

Problem 1: Add a New Student

```
Student=["Arun","Bala","kavin"]  
New_Student="Ravi"  
Student.append("Ravi")  
print("Update Student:",Student)
```

```
Student=["kavin"]  
New_Student="Mohan"  
Student.append("Mohan")  
print("Update Student:",Student)
```

```
Student=[]  
New_Student="Priya"  
Student.append("Priya")  
print("Update Student:",Student)
```

```
Student=["A","B","C"]  
New_Student="D"  
Student.append("D")  
print("Update Student:",Student)
```

OUTPUT

Update Student: ['Arun', 'Bala', 'kavin', 'Ravi']

Update Student: ['kavin', 'Mohan']

Update Student: ['Priya']

Update Student: ['A', 'B', 'C', 'D']

Problem 2: Add Multiple Subjects

```
Existing = ["Python", "Java"]
New = ["MySQL", "HTML", "CSS"]
Existing.extend(New)
print("Update Student:",Existing)
```

```
Existing = ["Python"]
New = ["Java","SQL"]
Existing.extend(New)
print("Update Student:",Existing)
```

```
Existing = ["C","C++"]
New = ["Java"]
Existing.extend(New)
print("Update Student:",Existing)
```

```
Existing = []
New = ["Python","Java"]
Existing.extend(New)
print("Update Student:",Existing)
```

```
Existing = ["HTML"]
New = ["CSS","JS","Bootstrap"]
Existing.extend(New)
print("Update Student:",Existing)
```

output

```
Update Student: ['Python', 'Java', 'MySQL', 'HTML', 'CSS']
```

```
Update Student: ['Python', 'Java', 'SQL']
```

```
Update Student: ['C', 'C++', 'Java']
```

```
Update Student: ['Python', 'Java']
```

```
Update Student: ['HTML', 'CSS', 'JS', 'Bootstrap']
```

Problem 3: Insert a Student at a Position

```
Student = ["Arun", "Bala", "Kavin", "Ravi"]
```

```
New_Student = "Mohan"
```

```
Student.insert(2,"Mohan")
```

```
print("Update Student:", Student)
```

```
Student = ["A","B","C"]
```

```
New_Student = "X"
```

```
Student.insert(1,"X")
```

```
print("Update Student:", Student)
```

```
Student = ["A","B","C"]
```

```
New_Student = "5"
```

```
Student.insert(0,"5")
```

```
print("Update Student:", Student)
```

```
Student = ["Java","Python"]
```

```
New_Student = "C++"
```

```
Student.insert(1,"C++")
```

```
print("Update Student:", Student)
```

```
Student = ["P","Q","R"]
```

```
New_Student = "S"
```

```
Student.insert(2,"S")
```

```
print("Update Student:", Student)
```

OUTPUT

```
Update Student: ['Arun', 'Bala', 'Mohan', 'Kavin', 'Ravi']
```

Update Student: ['A', 'X', 'B', 'C']

Update Student: ['S', 'A', 'B', 'C']

Update Student: ['Java', 'C++', 'Python']

Update Student: ['P', 'Q', 'S', 'R']

Problem 4: Remove a Cancelled Product

```
Cart = ["Laptop", "Mouse", "Keyboard", "Monitor"]
```

```
Remove = "Keyboard"
```

```
Cart.remove("Keyboard")
```

```
print("Update Student:", Cart)
```

```
Cart = ["Pen", "Book", "Bag"]
```

```
Remove = "Book"
```

```
Cart.remove("Book")
```

```
print("Update Student:", Cart)
```

```
Cart = ["A", "B", "C"]
```

```
Remove = "A"
```

```
Cart.remove("A")
```

```
print("Update Student:", Cart)
```

```
Cart = ["Java", "Python", "SQL"]
```

```
Remove = "SQL"
```

```
Cart.remove("SQL")
```

```
print("Update Student:", Cart)
```

```
Cart = ["Applw", "Mango", "Orange"]
```

```
Remove = "Mango"
```

```
Cart.remove("Mango")
```

```
print("Update Student:", Cart)
```

output

Update Student: ['Laptop', 'Mouse', 'Monitor']

Update Student: ['Pen', 'Bag']

Update Student: ['B', 'C']

Update Student: ['Java', 'Python']

Update Student: ['Applw', 'Orange']

Problem 5: Remove the Last Course

```
Course = ["Python", "Java", "SQL", "Spring"]
```

```
Course.pop(3)
```

```
print("Remove course=", "Spring")
```

```
print("Update Course):", Course)
```

```
Course = ["A", "B", "C"]
```

```
Course.pop(2)
```

```
print("Remove course=", "C")
```

```
print("Update Course):", Course)
```

```
Course = ["Python", "Java"]
```

```
Course.pop(1)
```

```
print("Remove course=", "Java")
```

```
print("Update Course):", Course)
```

```
Course = ["10", "20"]
```

```
Course.pop(1)
```

```
print("Remove course=", "20")
```

```
print("Update Course):", Course)
```

```
Course = ["Pen", "Book", "Bag"]
```

```
Course.pop(2)
```

```
print("Remove course=", "Bag")  
print("Update Course):", Course)
```

output

```
Remove course= Spring  
Update Course): ['Python', 'Java', 'SQL']  
Remove course= C  
Update Course): ['A', 'B']  
Remove course= Java  
Update Course): ['Python']  
Remove course= 20  
Update Course): ['10']  
Remove course= Bag  
Update Course): ['Pen', 'Book']
```

Problem 6: Find Student Position

```
Students = ["Arun", "Bala", "Kavin", "Ravi"]  
Search_Student = "Kavin"
```

```
print("Student =", Search_Student)  
print("Index =", Students.index(Search_Student))
```

```
Students = ["A", "B", "C"]  
Search_Student = "A"
```

```
print("Student =", Search_Student)  
print("Index =", Students.index(Search_Student))
```

```
Students = ["A", "B", "C"]  
Search_Student = "C"
```

```
print("Student =", Search_Student)
print("Index =", Students.index(Search_Student))
```

```
Students = ["Python", "Java", "SQL"]
Search_Student = "Java"
```

```
print("Student =", Search_Student)
print("Index =", Students.index(Search_Student))
```

```
Students = ["Red", "Green", "Blue"]
Search_Student = "Blue"
```

```
print("Student =", Search_Student)
print("Index =", Students.index(Search_Student))
```

output

Student = Gavin

Index = 2

Student = A

Index = 0

Student = C

Index = 2

Student = Java

Index = 1

Student = Blue

Index = 2

Problem 7: Count Repeated Marks

```
Marks = [80, 75, 90, 80, 65, 80]
```

```
Search_Mark = 80
```

```
print(Search_Mark, "occurred", Marks.count(Search_Mark), "times")
```

output

80 occurred 3 times
